

COOLING VEST SYSTEM

ABSTRACT OF THE DISCLOSURE

A basic vest is formed of a rear panel and laterally disposed front panels. The panels are fabricated of a material of low thermal insulation capabilities. A plurality of pockets has two laterally spaced rectangular front sheets located on the exterior surface of the front panels and two laterally spaced rectangular rear sheets located on the exterior surface of the rear panel. Each sheet has peripheral edges stitched to an associated panel and a free peripheral edge. An opening with fasteners there adjacent allow a wearer to open and close the opening. The sheets are fabricated of a material of high thermal insulation capabilities. A plurality of cooling packs is adapted to be placed in the pockets for dissipating the cooling temperature to a wearer.
